

EDUCATION

Massachusetts Institute of Technology

Cambridge, MA

Ph.D. candidate in Electrical Engineering and Computer Science, GPA: 5.0/5.0

Fall 2023 – Expected Spring 2028

- **Advisor:** Anantha P. Chandrakasan (Energy-Efficient Circuits and Systems Group)
- **Focus:** Hardware Security, Cryptographic ASIC Design

Seoul National University

Seoul, South Korea

M.S. in Intelligence and Information, GPA: 4.0/4.0

Fall 2021 – Summer 2023

- **Advisor:** Dongsuk Jeon (Mobile Multimedia Systems Group)
- **Focus:** Hardware Security, FHE Accelerator

Seoul National University

Seoul, South Korea

B.S. in Electrical and Computer Engineering, Summa Cum Laude, GPA: 3.92/4.0

Spring 2017 – Spring 2021

RESEARCH FOCUS

Hardware security architecture for post-quantum and privacy-preserving computation: protocol and system design, lattice-arithmetic datapath architecture (NTT, Keccak), side-channel and fault countermeasure integration, and silicon bring-up and security evaluation.

Two 28 nm cryptographic ASICs architected and taped out — a post-quantum authentication engine with on-chip TRNG and SCA/fault tolerance, measured in silicon and demonstrated live (CICC’26; JSSC under review), and a reconfigurable TFHE-CNN processor for encrypted inference with fault-injection characterization (ISSCC’27 under review).

Hardware-security and ASIC research is complemented by a strong computer architecture and systems foundation, including graduate coursework and hands-on projects in processor microarchitecture, parallel computing, and system-level C/CUDA programming.

FELLOWSHIPS & AWARDS

NAE Grand Challenge Vest Fellowship (Security section, Nominated, MIT EECS)

Spring 2026

MIT Presidential Graduate Fellowship Program

Fall 2023 – Summer 2024

RESEARCH EXPERIENCE

Post-Quantum Fuzzy Identity-Based Encryption (PQC-FIBE) Coprocessor with On-Device Biometric Key Derivation

MIT, Research Assistant | DARPA

Spring 2026 – Present

- Designing a unified cryptographic coprocessor that combines post-quantum security with personalized bio-authentication, eliminating reliance on external wireless communication for identity establishment in ingestible devices.
- Architecting a shared hardware datapath that multiplexes existing ML-KEM polynomial arithmetic (NTT, Keccak) for FIBE matrix operations, minimizing area/power overhead on ultra-constrained silicon.
- Developing a lightweight edge AI pipeline using multi-modal Siamese networks to extract stable “bio-fingerprints” from physiological signals, serving as identity keys for the PQC-FIBE scheme.

Reconfigurable TFHE-CNN Processor for Encrypted Inference — 28 nm ASIC

MIT, Research Assistant | ARPA-H

Fall 2025 – Present

- Developed a 28 nm ASIC with a reconfigurable TFHE datapath at 0.16–0.33 mJ/PBS, performing encrypted biometric matching and inference directly on ciphertext with no raw-data exposure — deployed between hospital servers and body area networks (BANs). [S1]
- Characterized the encrypted-inference datapath under fault injection. Taped out May 2026; submitted to ISSCC’27 (first author) [S1].
- In IP patent process through MIT TLO [D2].

Post-Quantum Authentication Engine with On-Chip TRNG and SCA/Fault Tolerance — 28 nm ASIC

MIT, Research Assistant | ARPA-H

Fall 2023 – Spring 2025

- Designed a 28 nm cryptoengine achieving $9.8\text{--}36.6\times$ PQC energy gains at 0.22 mm^2 and $0.86\text{ }\mu\text{J}/\text{Op}$, with an on-chip $8.5\text{ fJ}/\text{bit}$ TRNG and built-in side-channel and fault-injection countermeasures. [C1]
- Designed a lightweight post-quantum authentication protocol reducing energy by 61–76% on ARM Cortex-M4 through co-optimized PQC and lightweight cryptography (LWC); validated with in vitro/in vivo ingestible capsule prototypes. [C2]
- Performed chip bring-up and evaluation with Opal Kelly FPGA and custom PCB; live silicon demonstration at ISSCC’25 Student Research Preview.
- Extended version under review at *IEEE JSSC* (first author) [S2]; in IP patent process through MIT TLO [D1].
- Featured in MIT News [M1] and CNN [M2].

Key-Switching Accelerator for CKKS Fully Homomorphic Encryption — 28 nm ASIC

Seoul National University, Research Assistant

Fall 2021 – Summer 2023

- Designed a 28 nm key-switching accelerator with top-to-bottom optimizations spanning algorithm, architecture, and external-memory traffic: 39% fewer external memory accesses, $11.0\times$ faster than CPU, and $12.7\times$ higher energy efficiency than prior works. [C4]

High-Speed I/O and HBM Interface Research

Seoul National University, Research Assistant

Fall 2021 – Summer 2023

- SK Hynix collaboration: Developed WITCH crosstalk avoidance code for HBM, achieving 84.6% bit efficiency (+20.8% vs. prior) with 17–50% eye height improvement. [C3, J1]
- Samsung collaboration: Parametric Verilog sliding-block DFE for ADC-based SerDes receivers; BER simulation and optimization with XMODEL.

Quantized LSTM Training and Inference in a GPU-Based Framework

Seoul National University, Internship

Summer 2021

- Implemented quantized LSTM support in a PyTorch/CUDA training framework, maintaining quantized numerical formats throughout both training and inference.
- Analyzed model weight and activation distributions to characterize the impact of quantization on model accuracy.

INDUSTRY EXPERIENCE

Apple <i>Hardware Engineering Intern (SerDes, ADC-based RX)</i>	Waltham, MA <i>Summer 2026</i>
Samsung Electronics <i>Industry Research Collaboration (SerDes, ADC-based RX) during M.S.</i>	Seoul, South Korea <i>Fall 2021 – Summer 2023</i>
SK Hynix <i>Industry Research Collaboration (HBM crosstalk reduction) during M.S.</i>	Seoul, South Korea <i>Fall 2021 – Summer 2023</i>

SKILLS

Security & Cryptography: ML-KEM (Kyber), TFHE, CKKS, fuzzy identity-based encryption, lightweight cryptography (LWC); side-channel analysis and countermeasures, fault-injection tolerance, true random number generation

Computer Architecture & Systems: Graduate Advanced Computer Architecture: extended SimpleScalar for out-of-order execution and coarse-grained multithreading; Parallel Computing: distributed/parallel programming with CUDA and OpenMP; Systems Programming: C for system-level software

Languages: C, C++, CUDA, Python, Perl, GoLang, Verilog/SystemVerilog, Tcl, Matlab

Design & Verification: VCS/Xcelium, XMODEL, Design Compiler/Genus, ICC2, Innovus, PrimeTime, PrimePower, PrimeLib, Virtuoso

Silicon Bring-up & Evaluation: Opal Kelly FPGA, custom PCB design (Altium), ChipWhisperer

PATENTS & INVENTION DISCLOSURES

- [D1] S. Jang, et al., “Area- and Energy-Efficient Post-Quantum Authentication Engine with On-Chip Entropy Source and Early-Termination Fault Detection,” MIT Technology Licensing Office, Case No. 27469, accepted August 2026. (*Under evaluation for patent filing*)
- [D2] S. Jang, et al., “Reconfigurable TFHE-CNN Processor for Encrypted Personal-Hub Inference,” MIT Technology Licensing Office, Case No. 27502, accepted September 2026.
- [P1] S. Jeon, **S. Jang**, K. Shin, H. Chi, W. Shin, C. Pyo, D. Jeon, “Semiconductor Device for Reducing Crosstalk Noise,” US Patent Application No. US20260031855A1, filed Oct. 2024, published Jan. 2026. Assignees: SK Hynix Inc., Seoul National University R&DB Foundation. (*Pending*)
- [P2] S. Jeon, **S. Jang**, K. Shin, H. Chi, W. Shin, C. Pyo, D. Jeon, “Semiconductor Device for Reducing Crosstalk Noise,” US Patent Application No. US20260051924A1, filed Oct. 2024, published Feb. 2026. Assignees: Seoul National University R&DB Foundation, SK Hynix Inc. (*Pending*)

PRESENTATIONS

CICC 2026 Oral Presentation — 28nm post-quantum secure authentication engine [C1].

ISSCC 2025 Student Research Preview (SRP) — 28nm PQC cryptoengine with live silicon demo.

EMBC 2025 Oral Presentation — Ultra-low-power post-quantum secure communication protocol [C2].

ARPA-H Sponsor Review Meetings — Technical presentations and live demonstrations of PQC and TFHE hardware (recurring).

MENTORING

Master of Engineering (MEng) Mentor

MIT

Summer 2026 – Present

- Supervising an MEng student extracting bio-fingerprints from physiological signals for integration into the PQC-FIBE on-device authentication scheme.

Undergraduate Research Opportunities Program (UROP) Mentor

MIT

Spring 2026 – Summer 2026

- Supervised two first-year undergraduate researchers on differentiable logic gate networks (DLGNs) for TFHE-compatible neural network inference.
